

# Setup AWS EC2 webserver using TERRAFORM

Screenshot showing EC2 created in the console

Screenshot of the webpage displaying the terraform statement

Terraform is an open-source tool for provisioning and managing infrastructure as code. Developed by HashiCorp, Terraform is cloud-agnostic, enabling it to work seamlessly across various cloud providers. It utilizes a declarative programming approach, allowing users to define the desired state of their infrastructure. Terraform is highly expressive and extendable, meaning it can be integrated with a wide range of software through plugins, making it a versatile solution for infrastructure automation.
